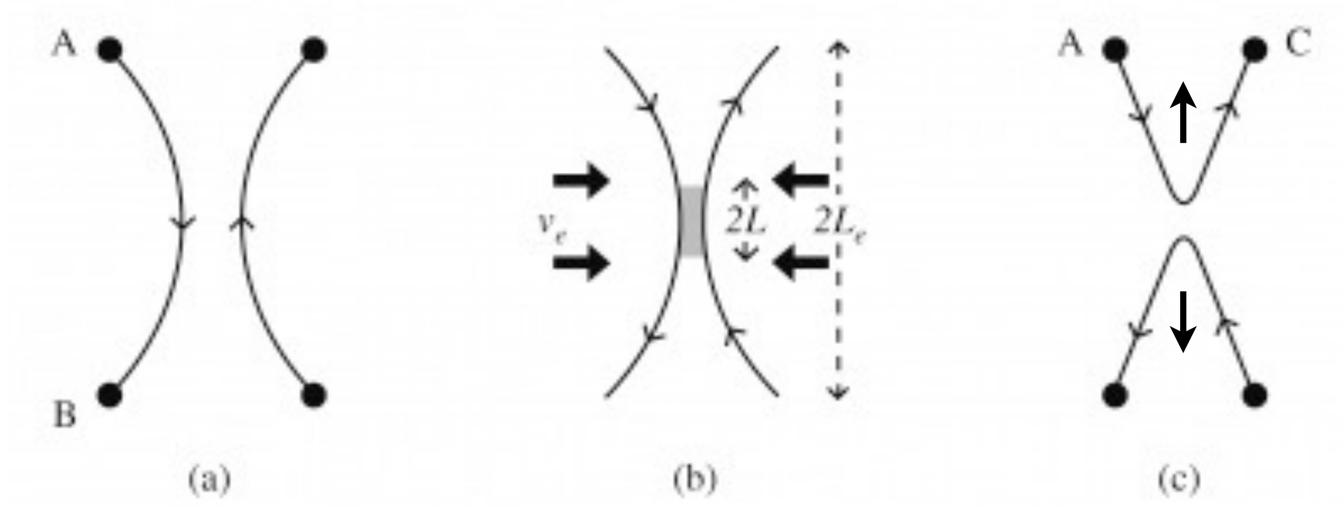
Magnetic Reconnection & Associated Particle Acceleration



Where does reconnection occur?

- Planetary magnetosphere, solar flares
- Active galactic nuclei (AGN), Gamma-ray bursts (GRBs), Pulsar wind nebulae (PWNs)

Particle Acceleration: Hints from solar flares

- Power-law distribution
- A large fraction of electrons are accelerated

$N_{nonthermal} > N_{thermal}$ (e.g., Krucker et al. 2010)

This is not well understood.

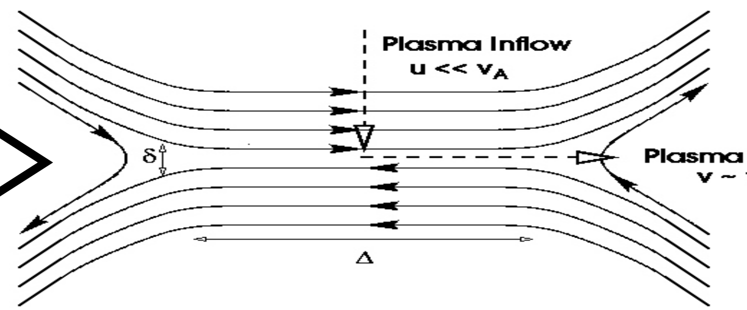
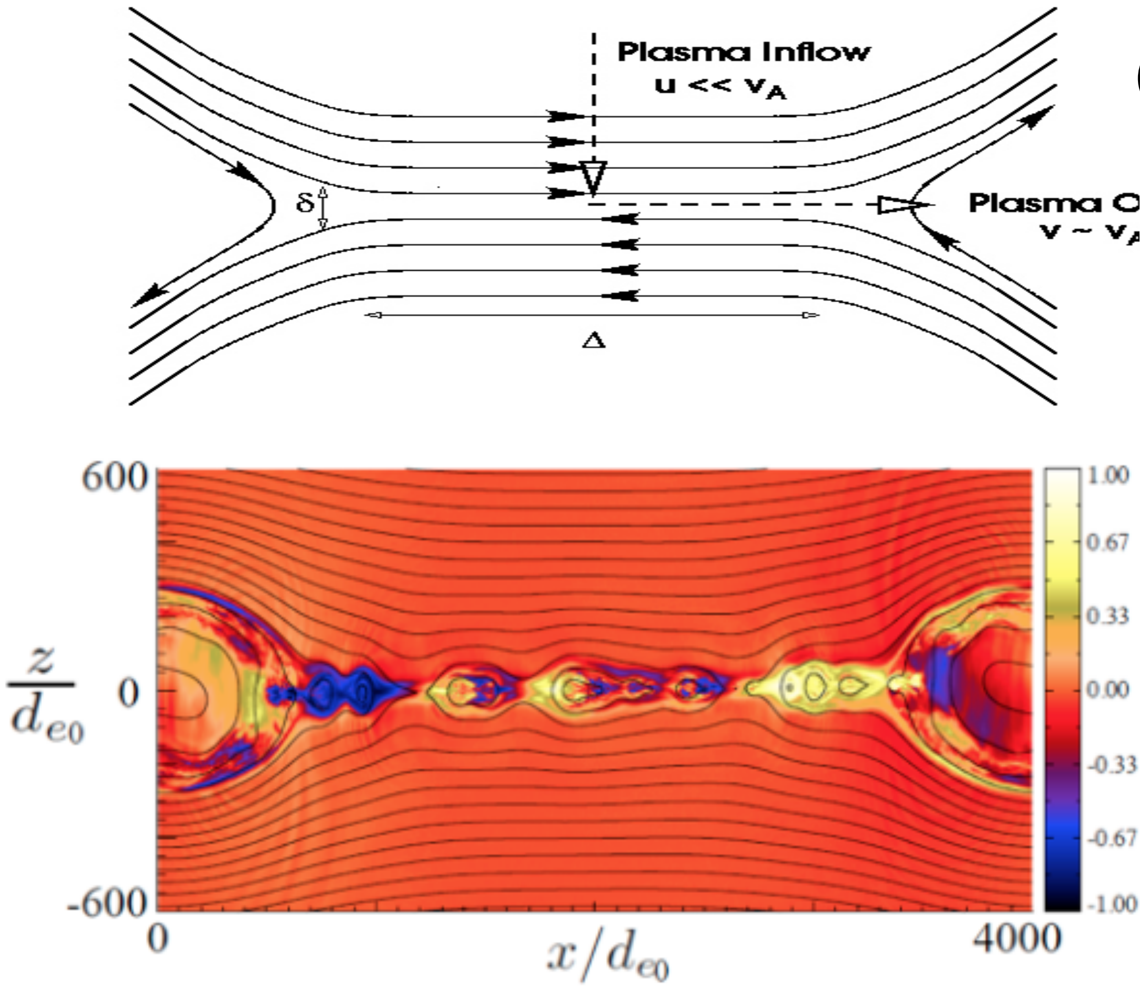
A general local geometry: current sheets



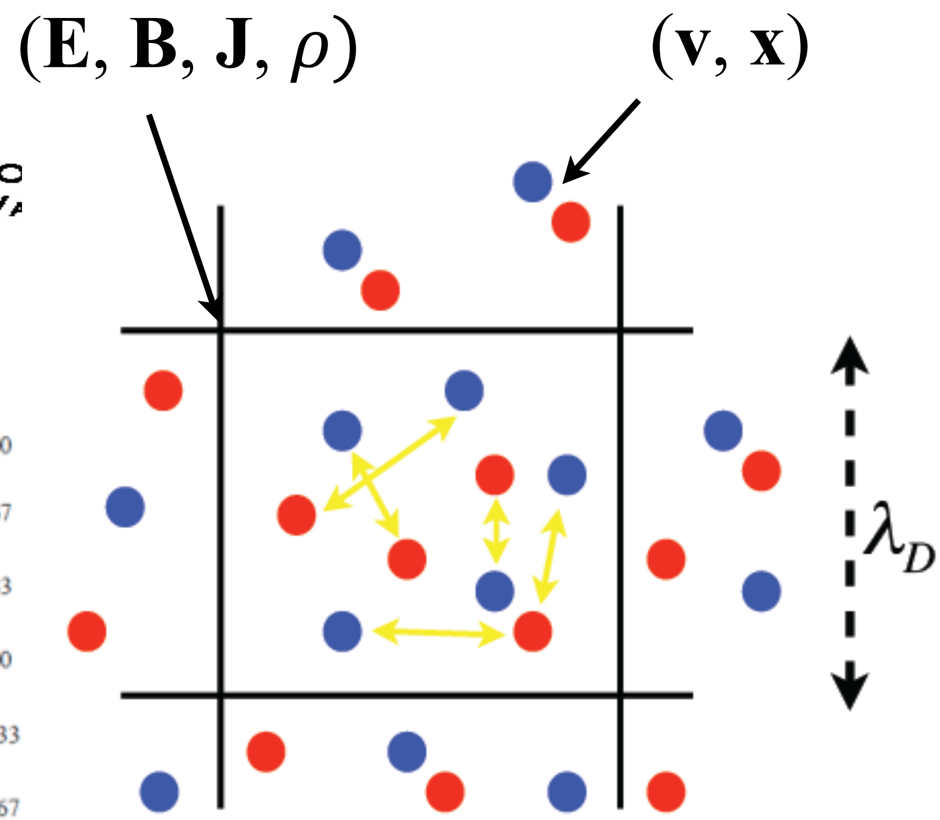
$$\sigma = \frac{B^2}{4\pi n m c^2} \gg 1$$

$$v_A \sim c$$

Focusing on a local reconnection site with σ>>1



Particle-in-Cell simulation



GF et al. 2014 PRL, 2015a ApJ (pair, particle acc.)
2015b arxiv 1511.01434 (ion-electron, particle acc.)
Liu, GF, Daughton, Li, Hesse 2015 PRL (fast outflow/dissipation)
Li, GF, Li et al. 2015 ApJL - nonrelativistic reconnection

Focusing on a local reconnection site with σ>>1 Key results:

- Efficient particle acceleration and formation of power laws $dN/d\gamma = \gamma^{-p}$, and extending to $\gamma_i = \sigma,\ \gamma_e = (m_i/m_e)\sigma$
- Main Acceleration mechanism: first-order relativistic Fermi process
- Power-law model and formation condition ($\tau_{acc} < \tau_{inj}$).
- Properties of relativistic magnetic reconnection:
  Relativistic inflow and outflow
  Reconnection rate is enhanced because of relativistic effect
  2D & 3D rates are similar

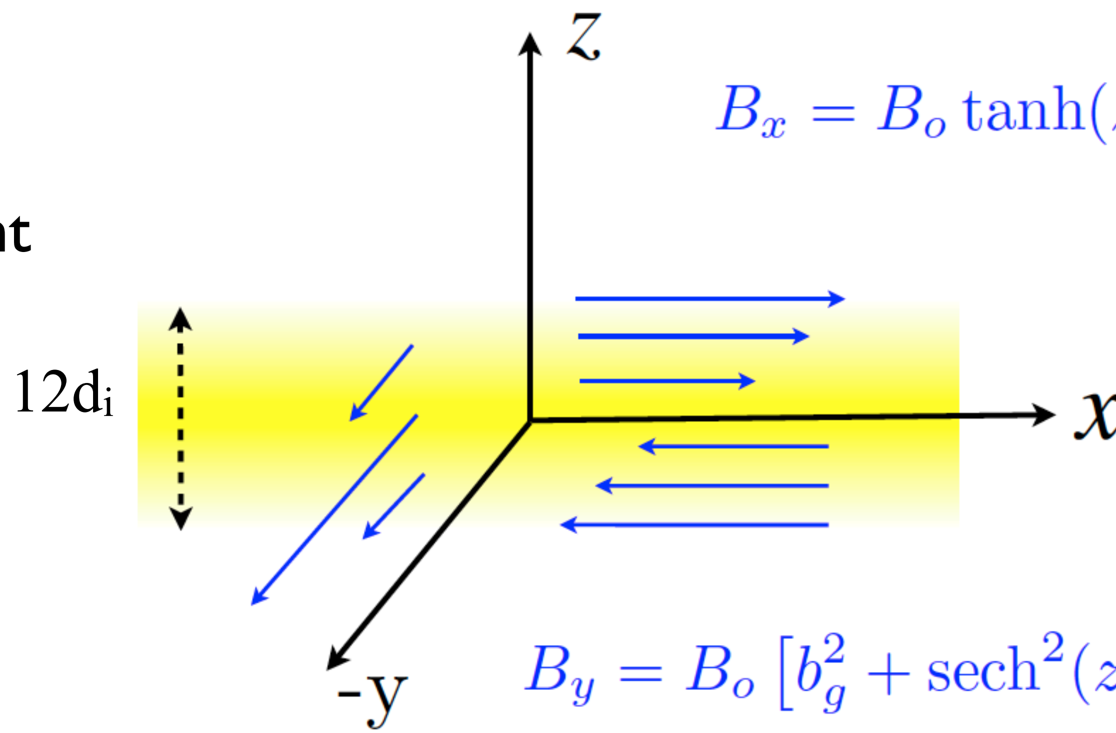
Initial Setup & Parameters

- Force-free current sheet

- Magnetic energy dominant initially $E_B >> E_k$

- Pair plasma (m_i/m_e = 1)
- Proton-electron plasma (m_i/m_e up to 1836)



$$B_x = B_o \tanh(z/\lambda)$$

$$B_y = B_o \left[b_g^2 + \mathrm{sech}^2(z/\lambda)\right]^{1/2}$$

2D: σ = 1-1600

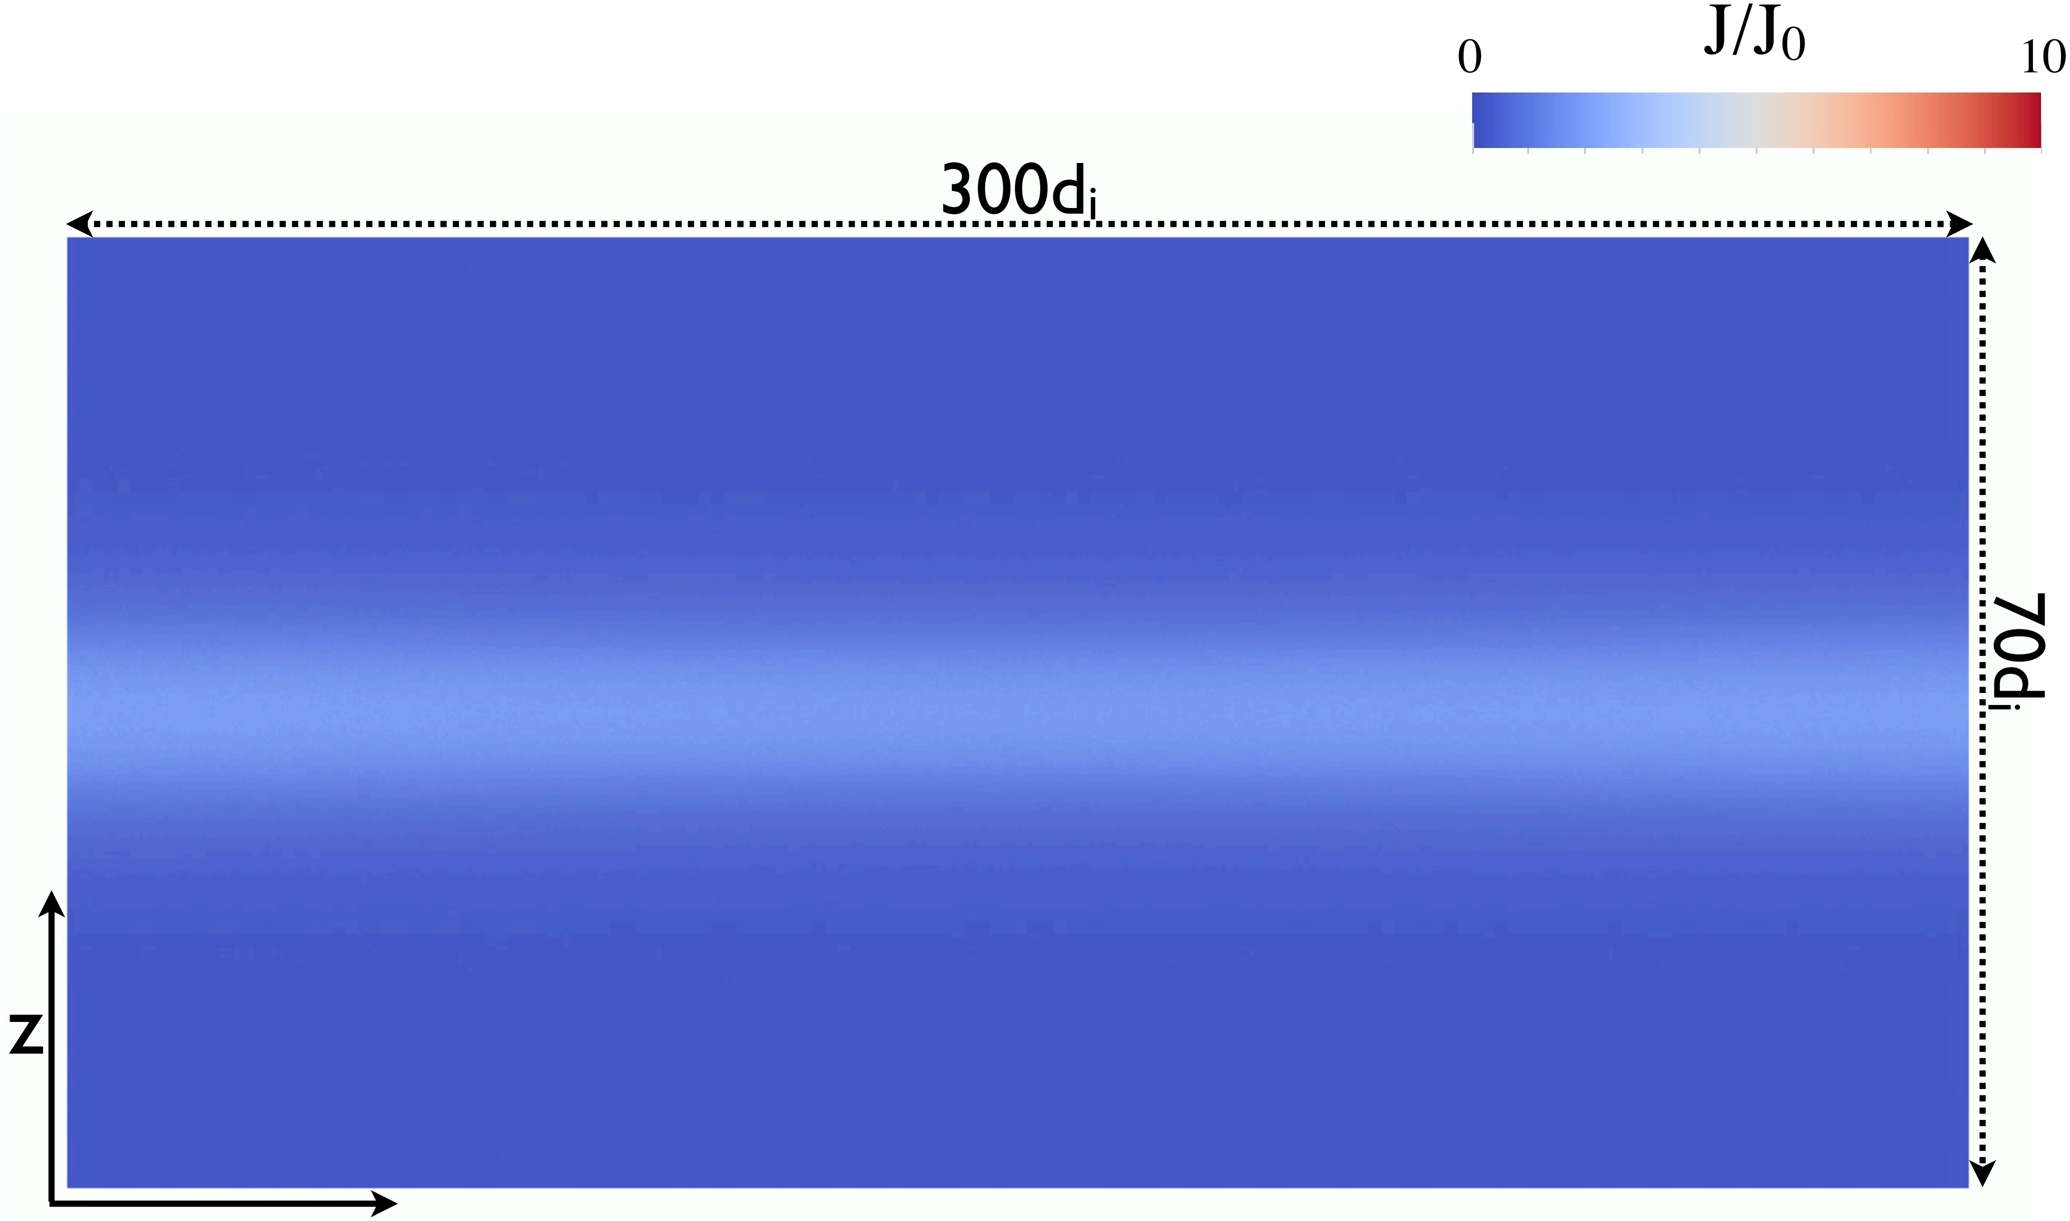
Boundary conditions: mainly periodic currently exploring open boundary cases

3D: σ up to 100

$$L_x \times L_z \times L_y = 300 d_i \times 194 d_i \times 300 d_i$$

~1.4 trillion particles and 2048^3 grids, using 10^5 CPU-cores on Blue Waters

2D current density (σ=100, m_i/m_e = 1) $\omega_{pe}t$=0 - 700



No kink instability

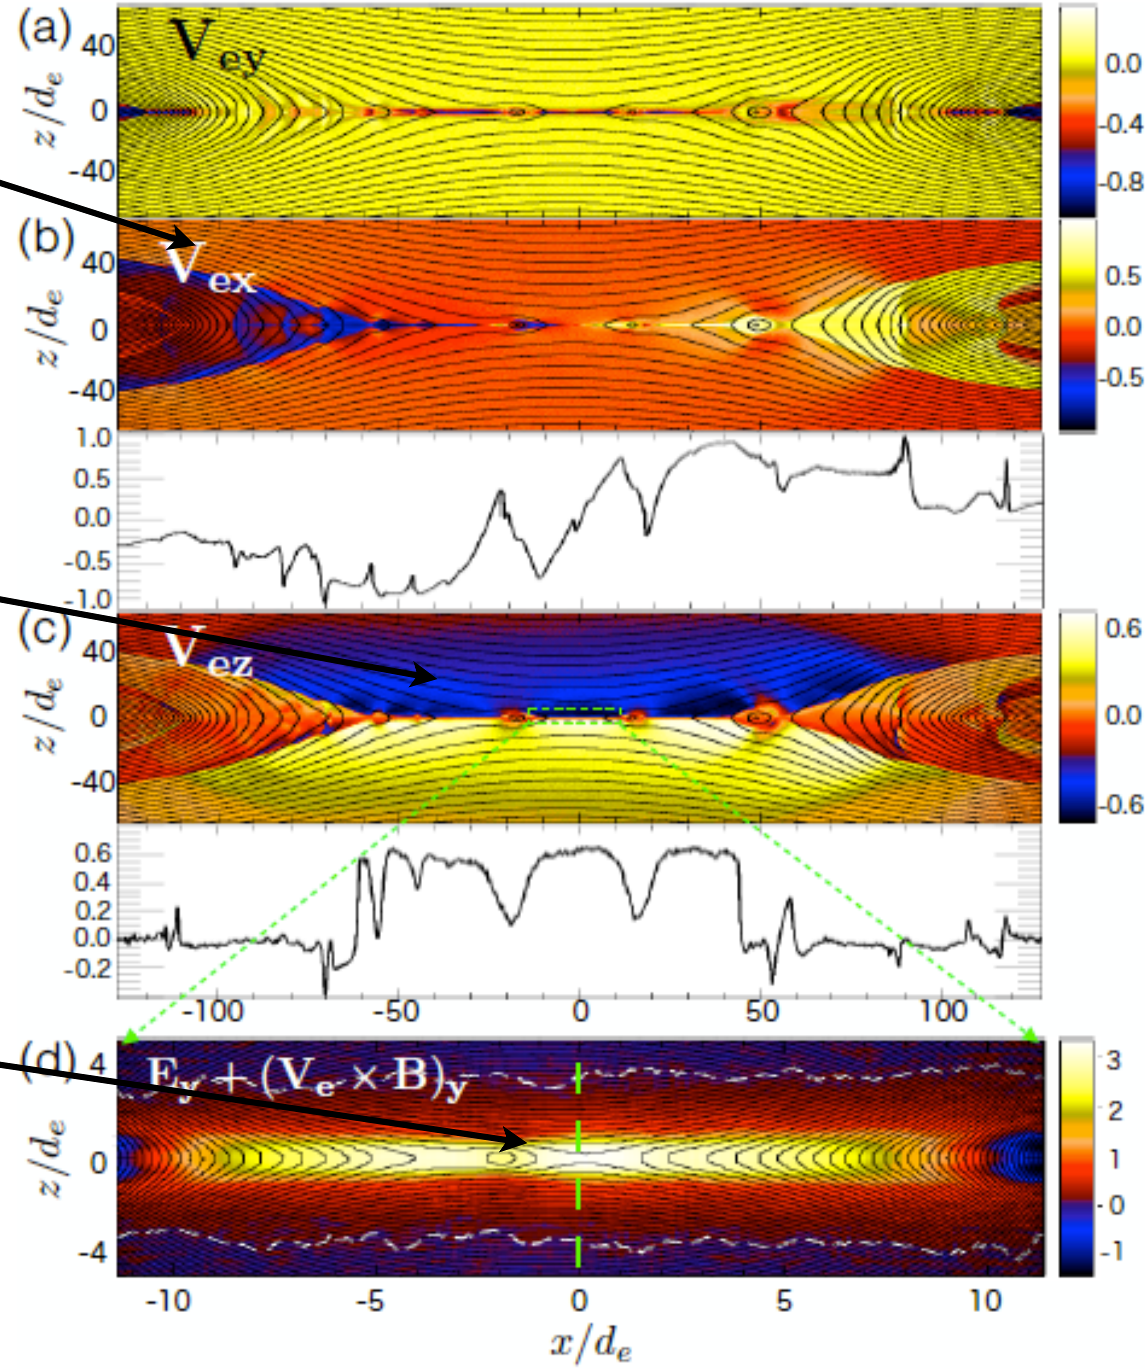
Plasma flows associated with reconnection

Relativistic outflow speed

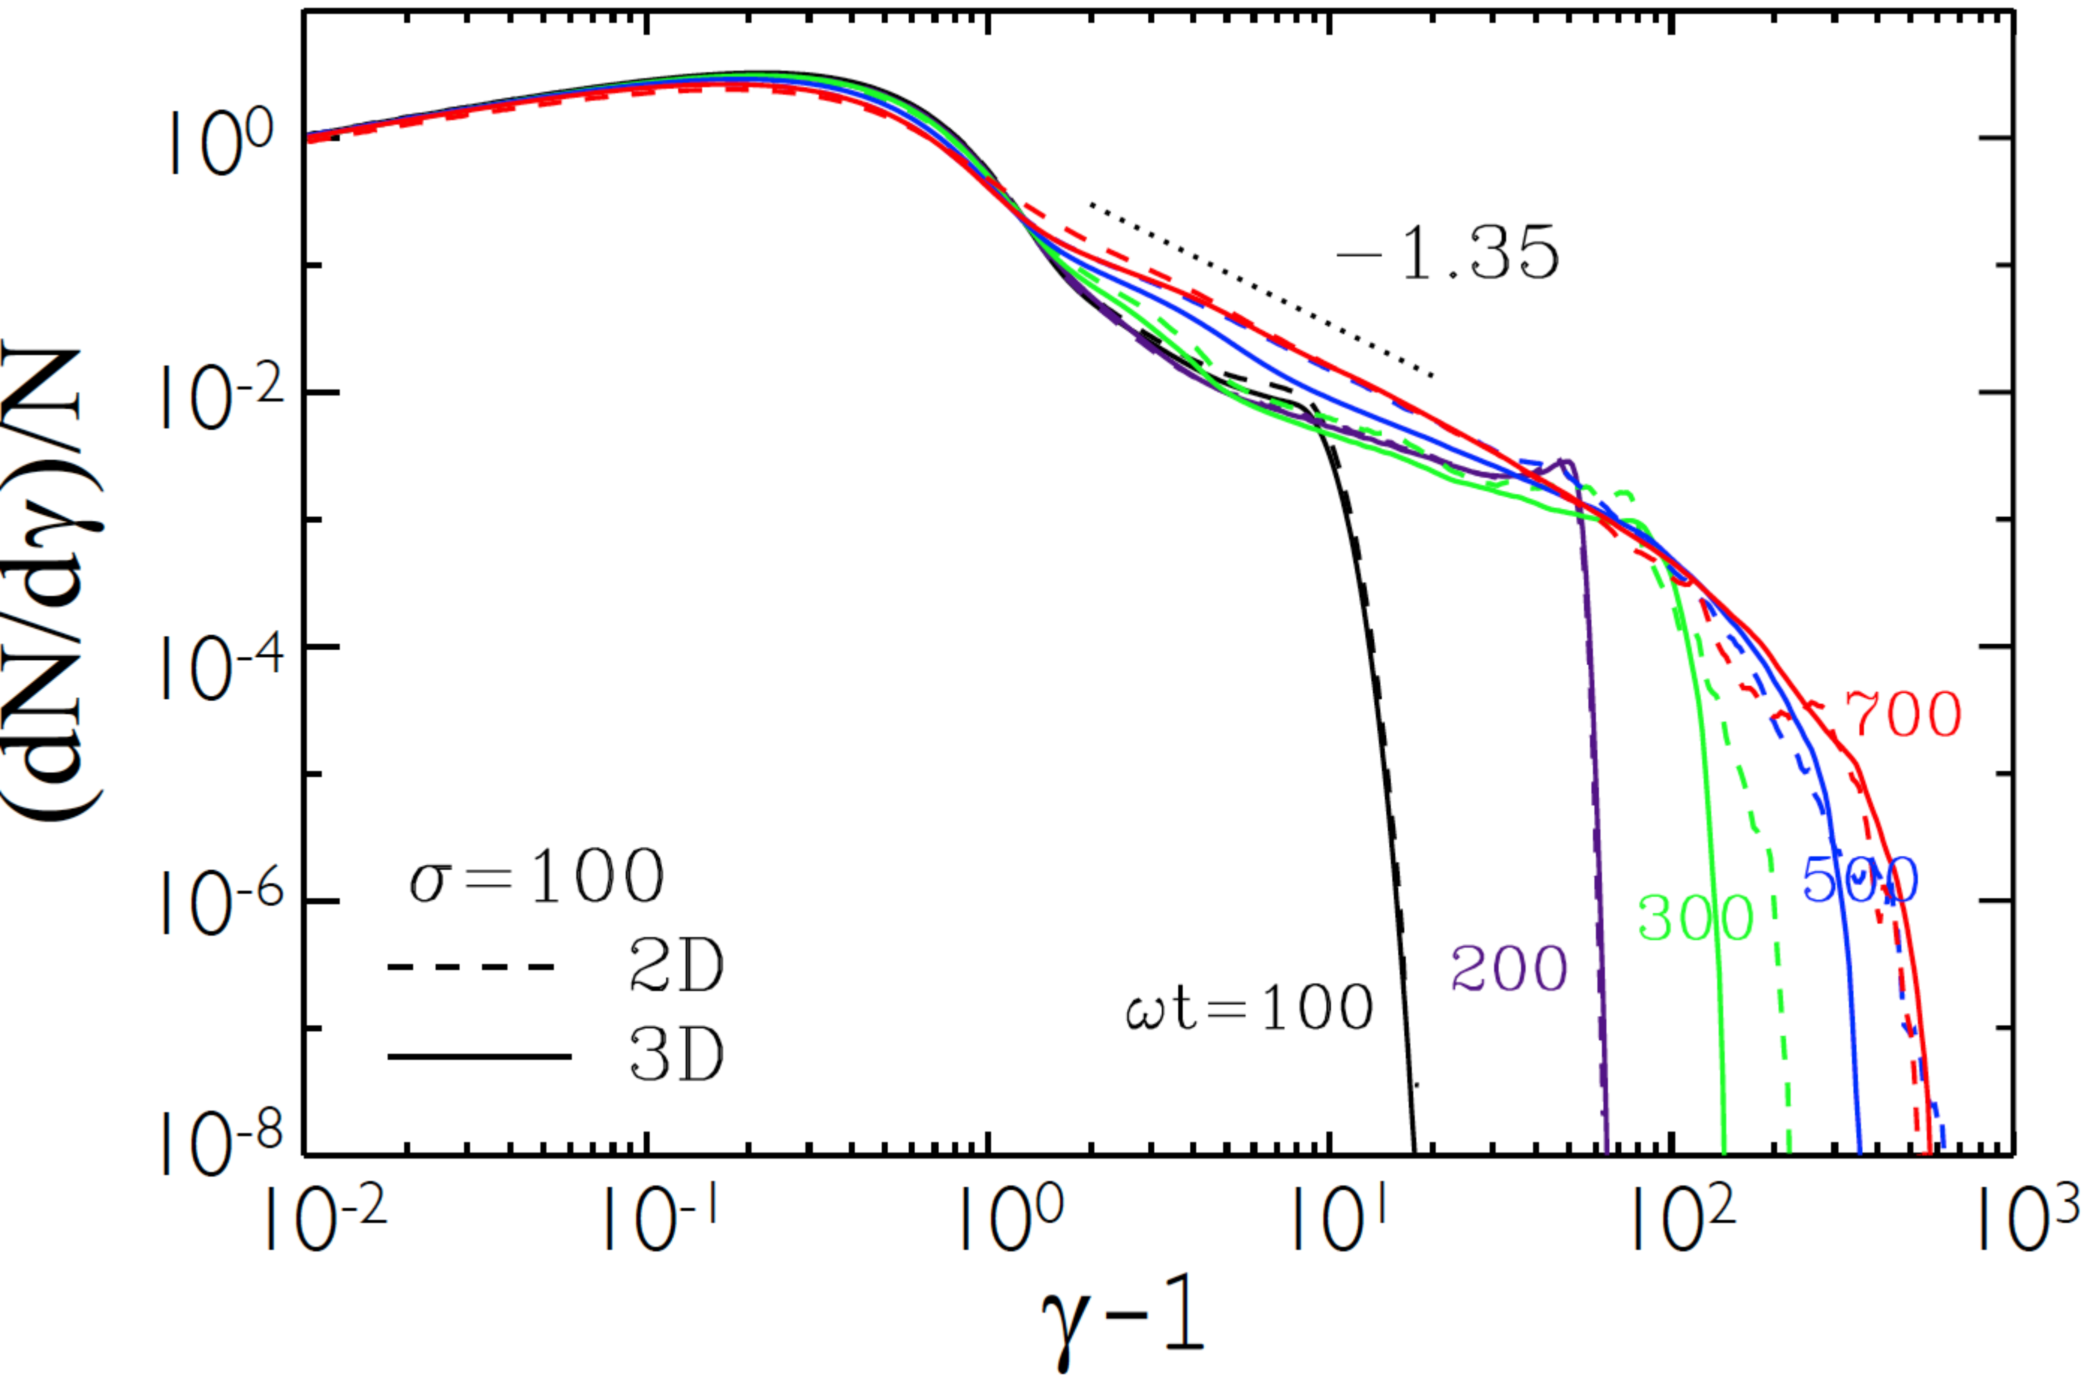
enhanced inflow speed

current structure aspect ratio ~ 0.1

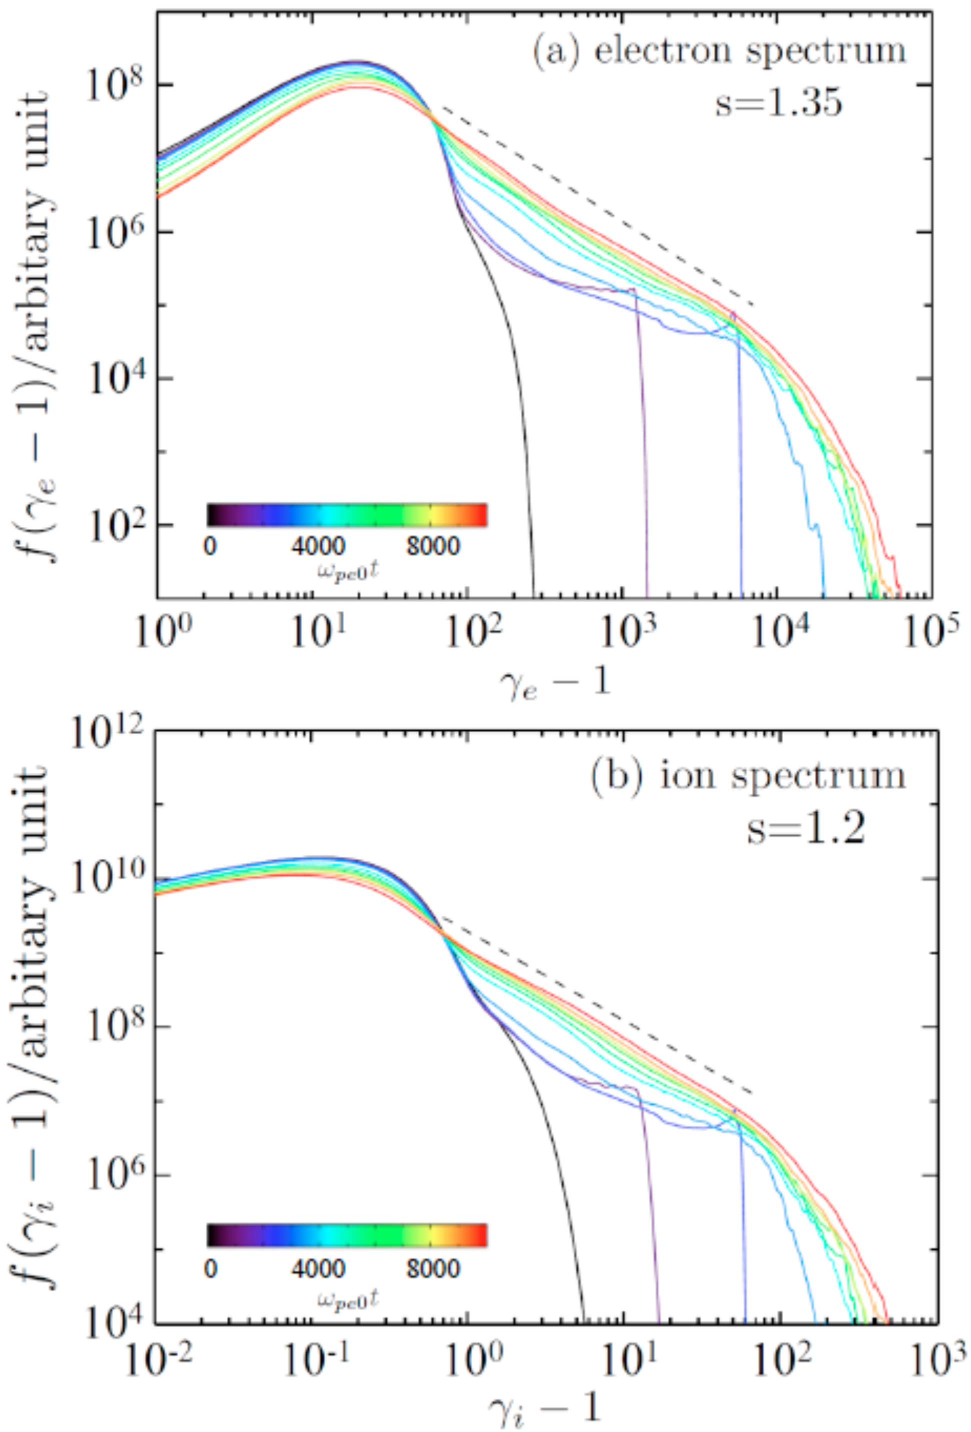


(Liu, Y., GF et al. 14 PRL, Guo et al. 2015)

Energy spectra from 2D and 3D PIC simulations



A relativistic run with σ = 100, mi/me=100



Spectral index s ~ 1

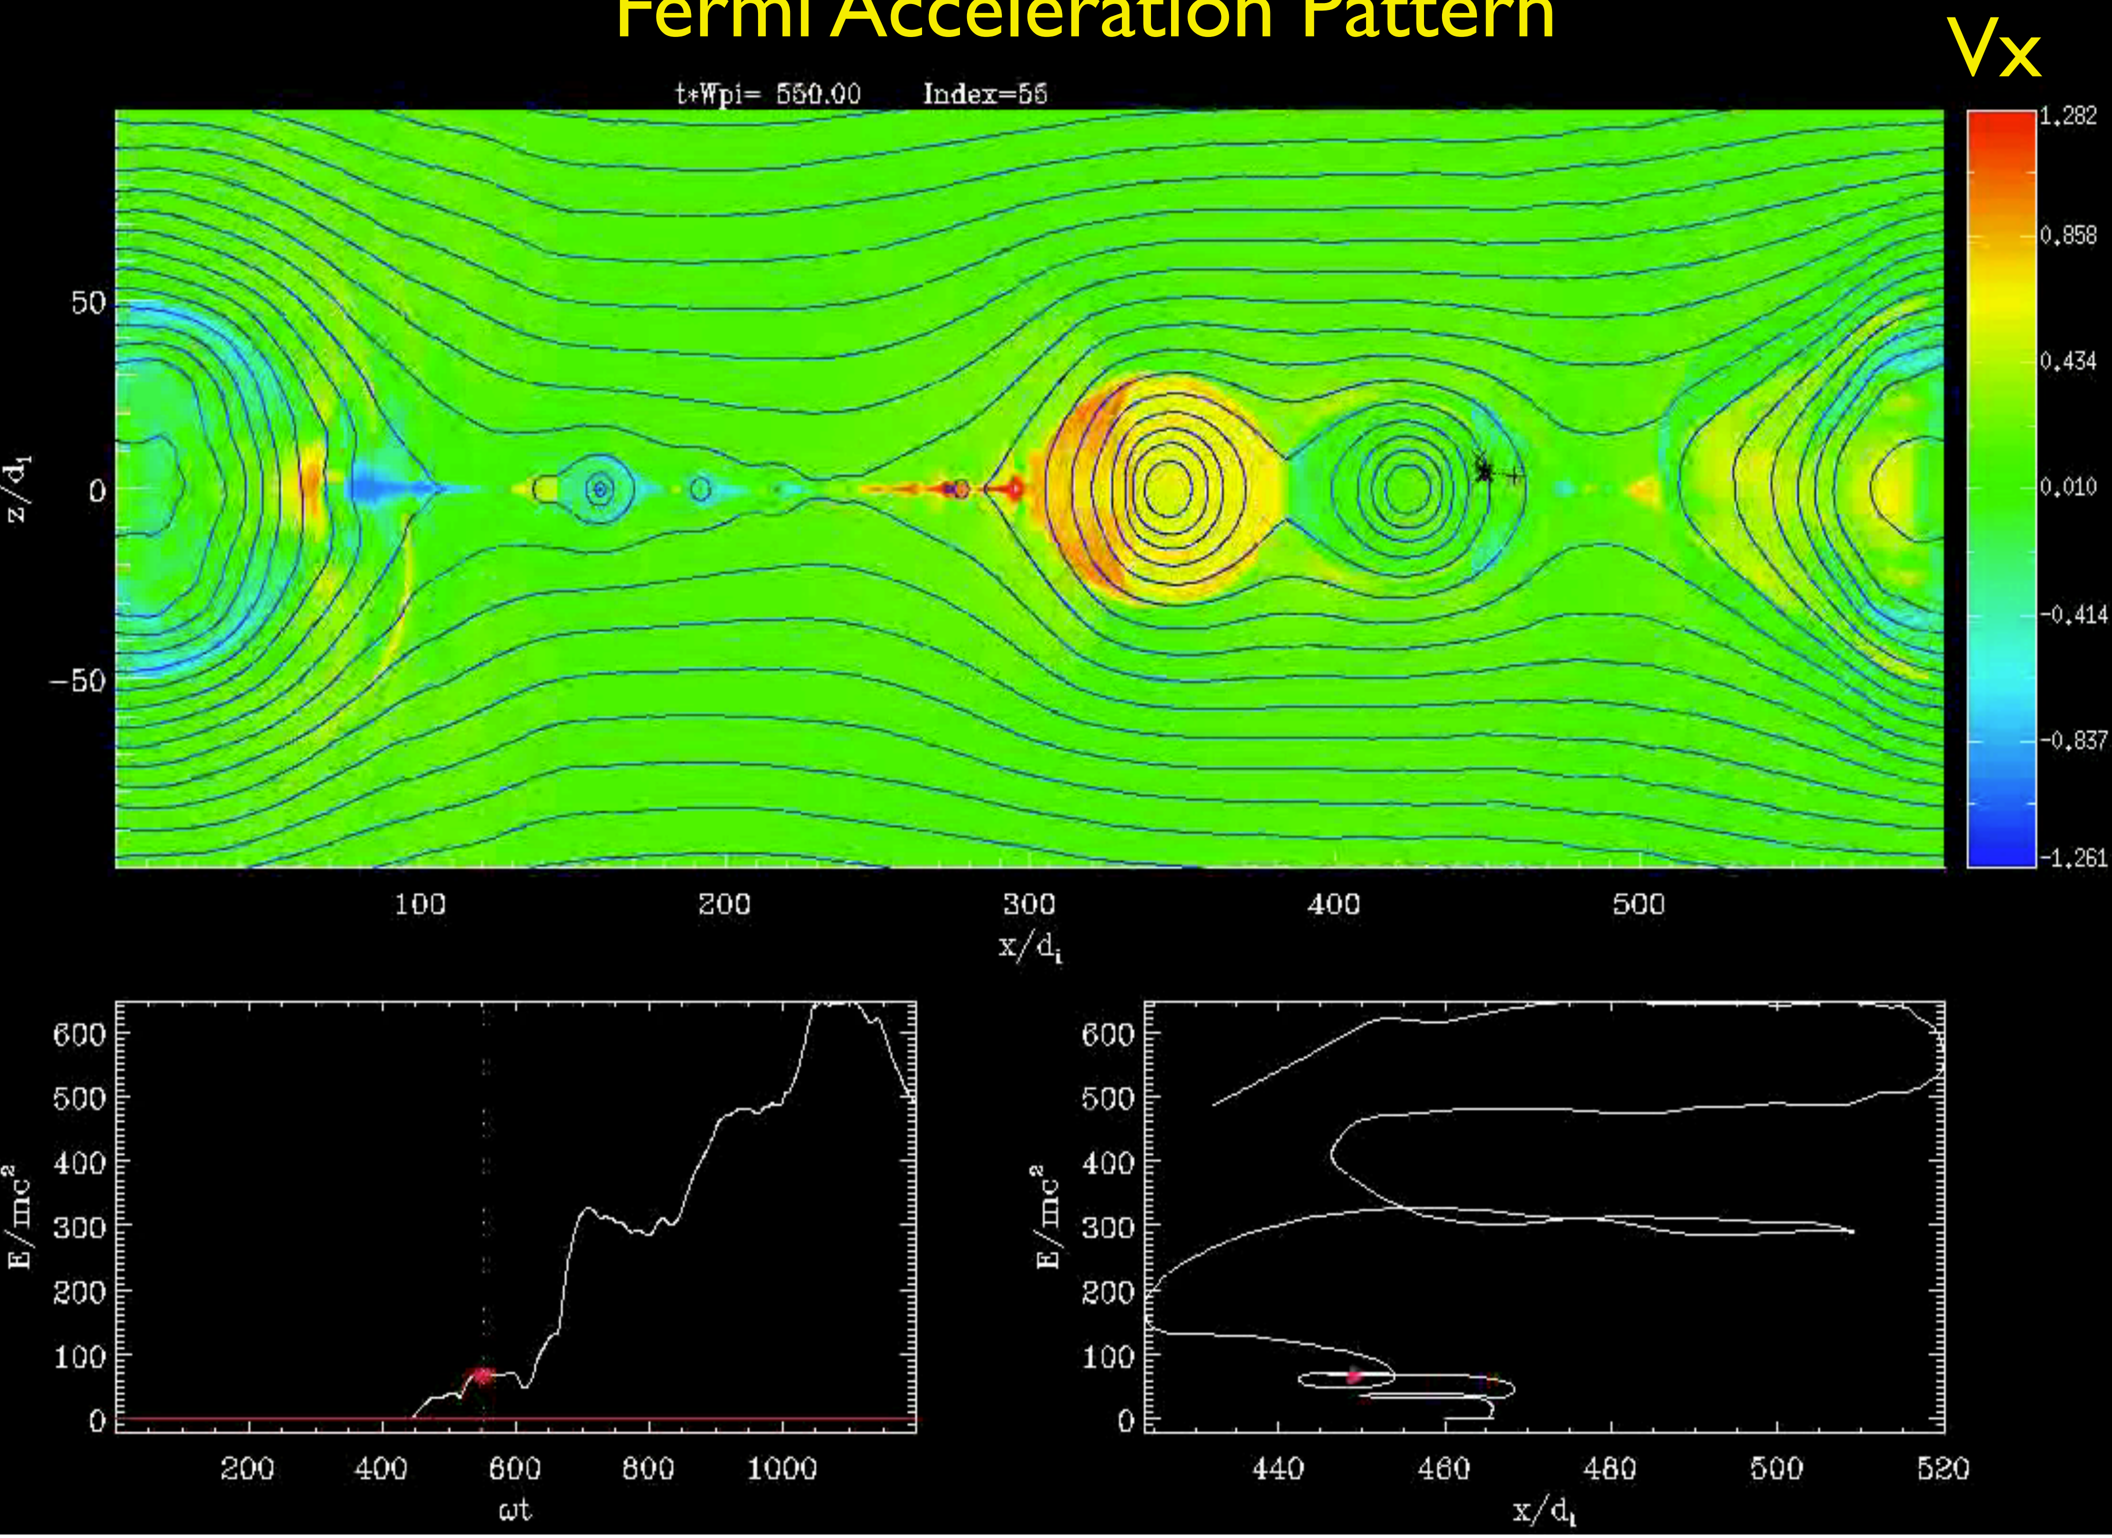
Fast variability ~ Lx/c

$$\gamma_i = \sigma, \; \gamma_e = (m_i/m_e)\sigma$$

$$\varepsilon_{max} = \int |qE_{rec}| c dt$$

slopes are identical in momentum space

Fermi Acceleration Pattern



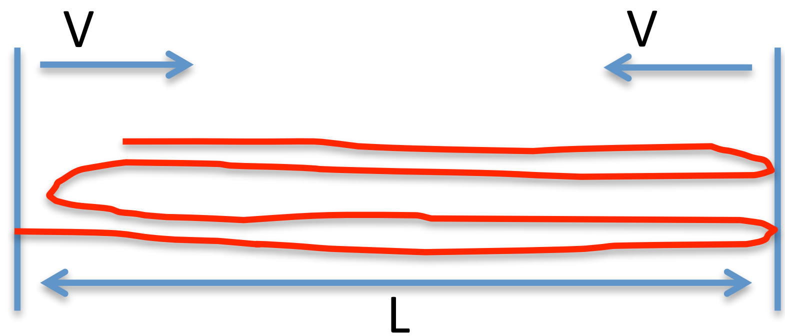
1st order Fermi mechanism

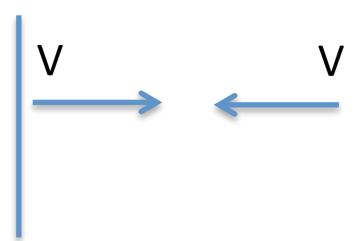
• Acceleration by "collision" in between moving magnetic clouds (Fermi 1949)

$$\Delta\gamma = \left(\Gamma^2(1+\frac{2Vv_x}{c^2}+\frac{V^2}{c^2})-1\right)\gamma$$

$$\Delta t = L_{is}/v_x$$

$$\alpha = \Delta\gamma/(\gamma\Delta t)$$

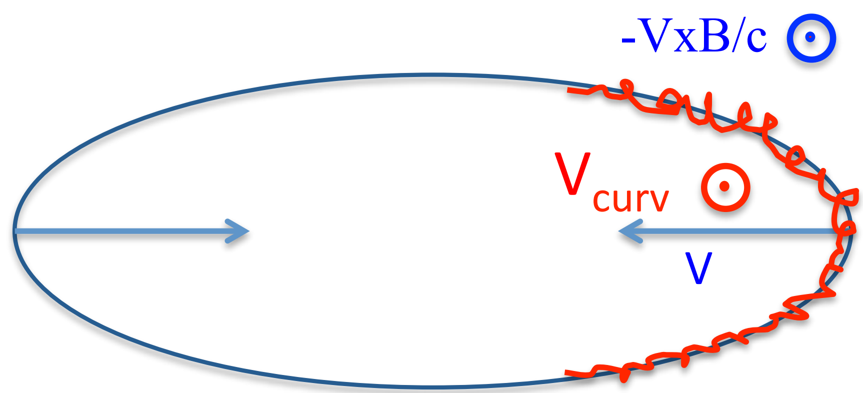




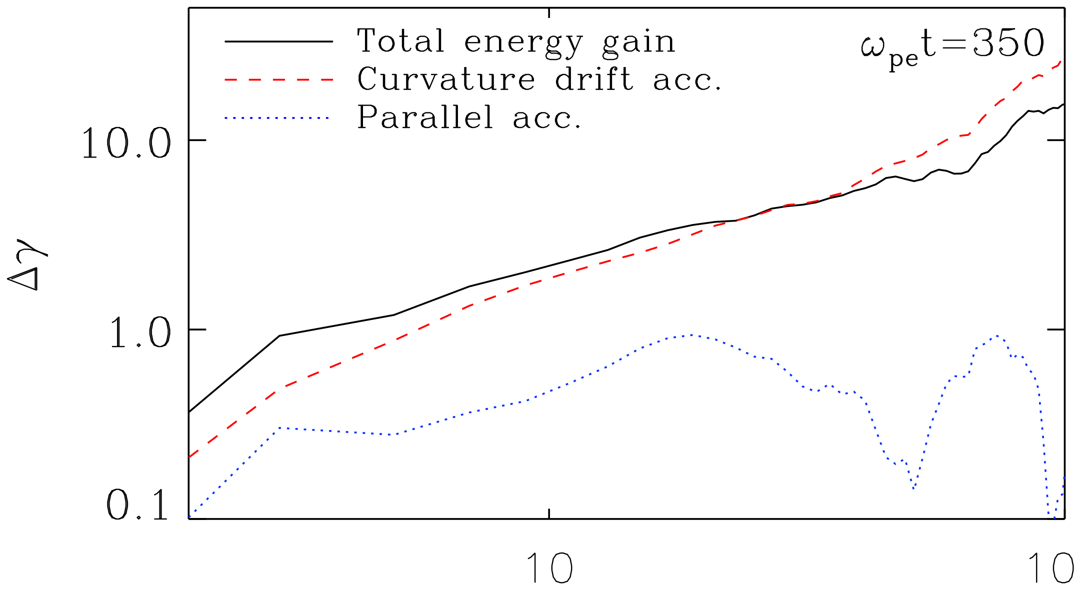
• In large-scale simulations, the dominant electric field for energy release

$$E = -V \times B/c$$

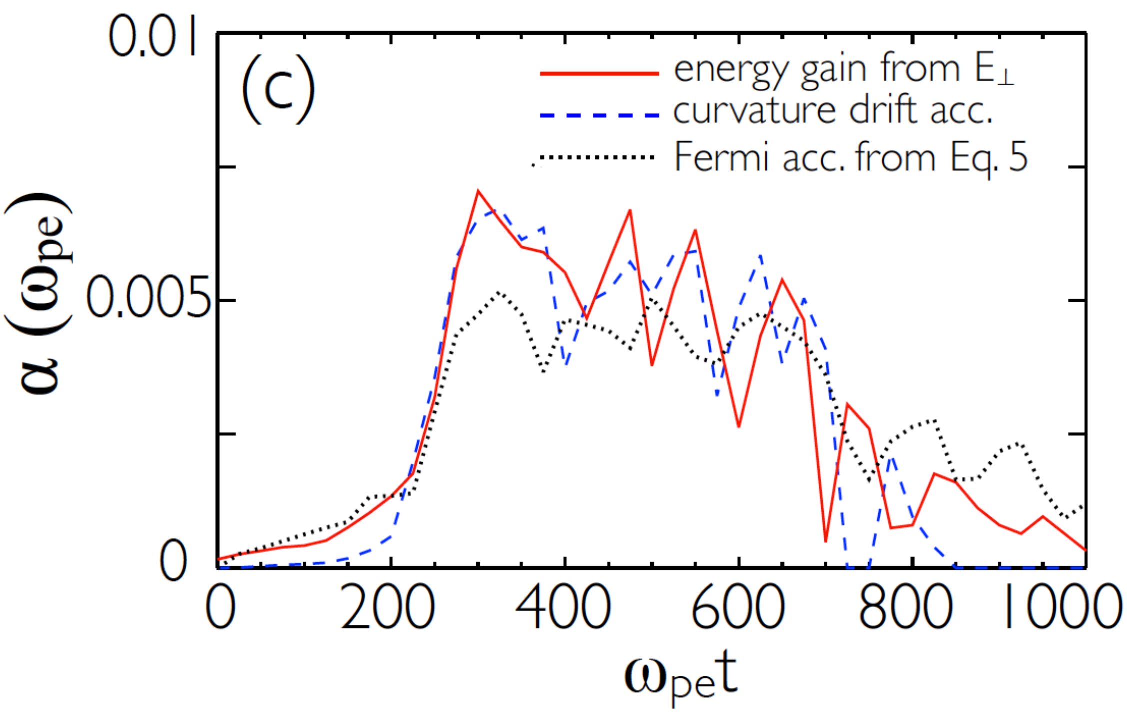
• In reconnection region, the Fermi process is accomplished by curvature drift motion in plasmoids along the motional electric field.



Type-B Fermi process (Fermi 1949)
Drake et al. 2006, 2010; Birn et al. 2012
Guo et al. 2014



The acceleration is dominated by energy gain through curvature drift motion



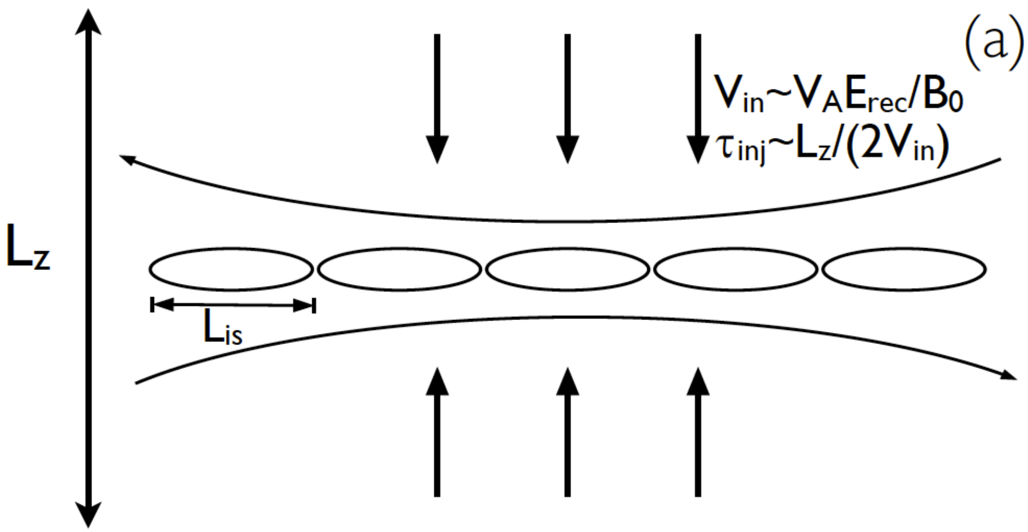
Fermi acceleration formula agrees with the acceleration by curvature drift motion.

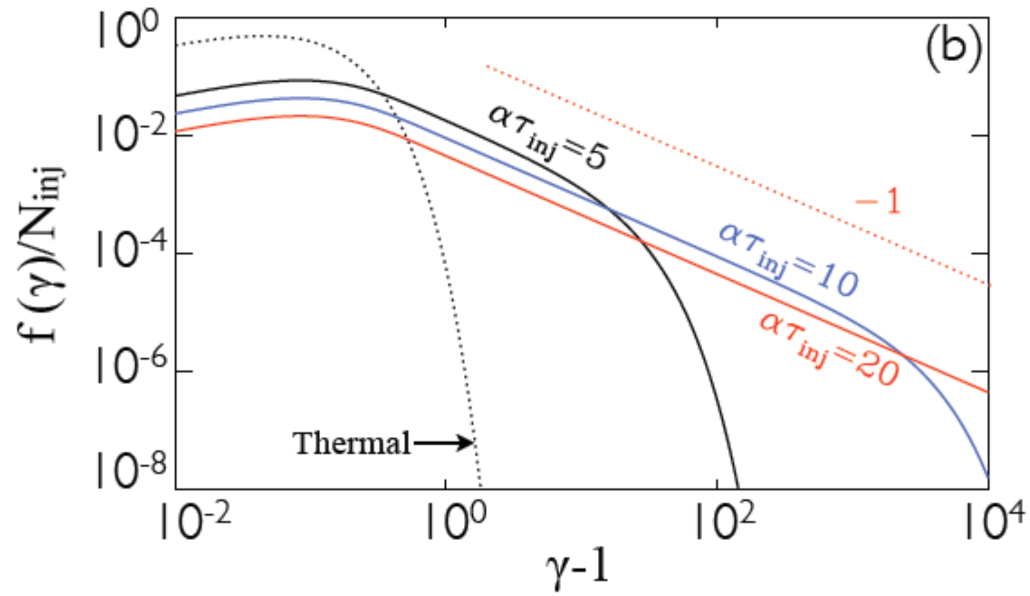
$$\Delta\gamma = \left(\Gamma^2(1 + \frac{2Vv_x}{c^2} + \frac{V^2}{c^2}) - 1\right)\gamma$$

$$\Delta t = L_x / v_x$$

$$\alpha = \Delta\gamma / (\gamma\Delta t)$$

Power-law formation





$$\frac{\partial f}{\partial t} + \frac{\partial}{\partial \varepsilon}\left(\frac{\partial \varepsilon}{\partial t} f\right) = \frac{f_{inj}}{\tau_{inj}} - \frac{f}{\tau_{esc}} \qquad f \propto \varepsilon^{-(1+\frac{1}{\alpha\tau_{esc}})}$$

Two parts in the final solution:

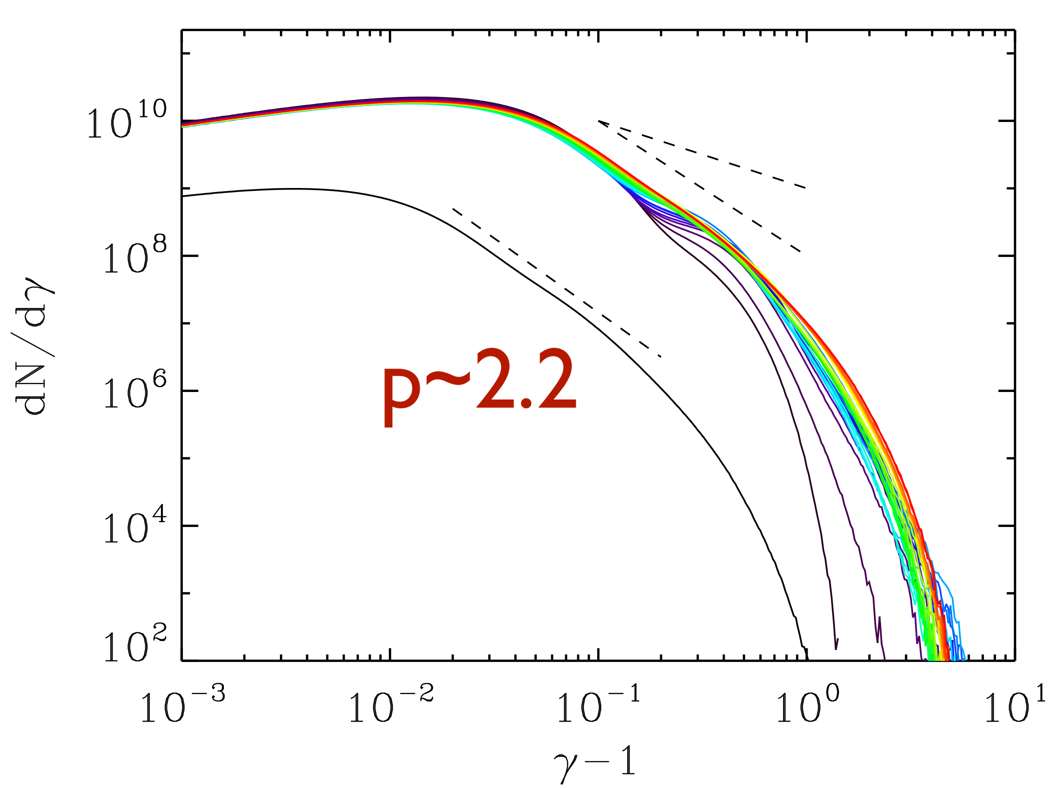
1) Particles initially in the current layer: heated thermal distribution

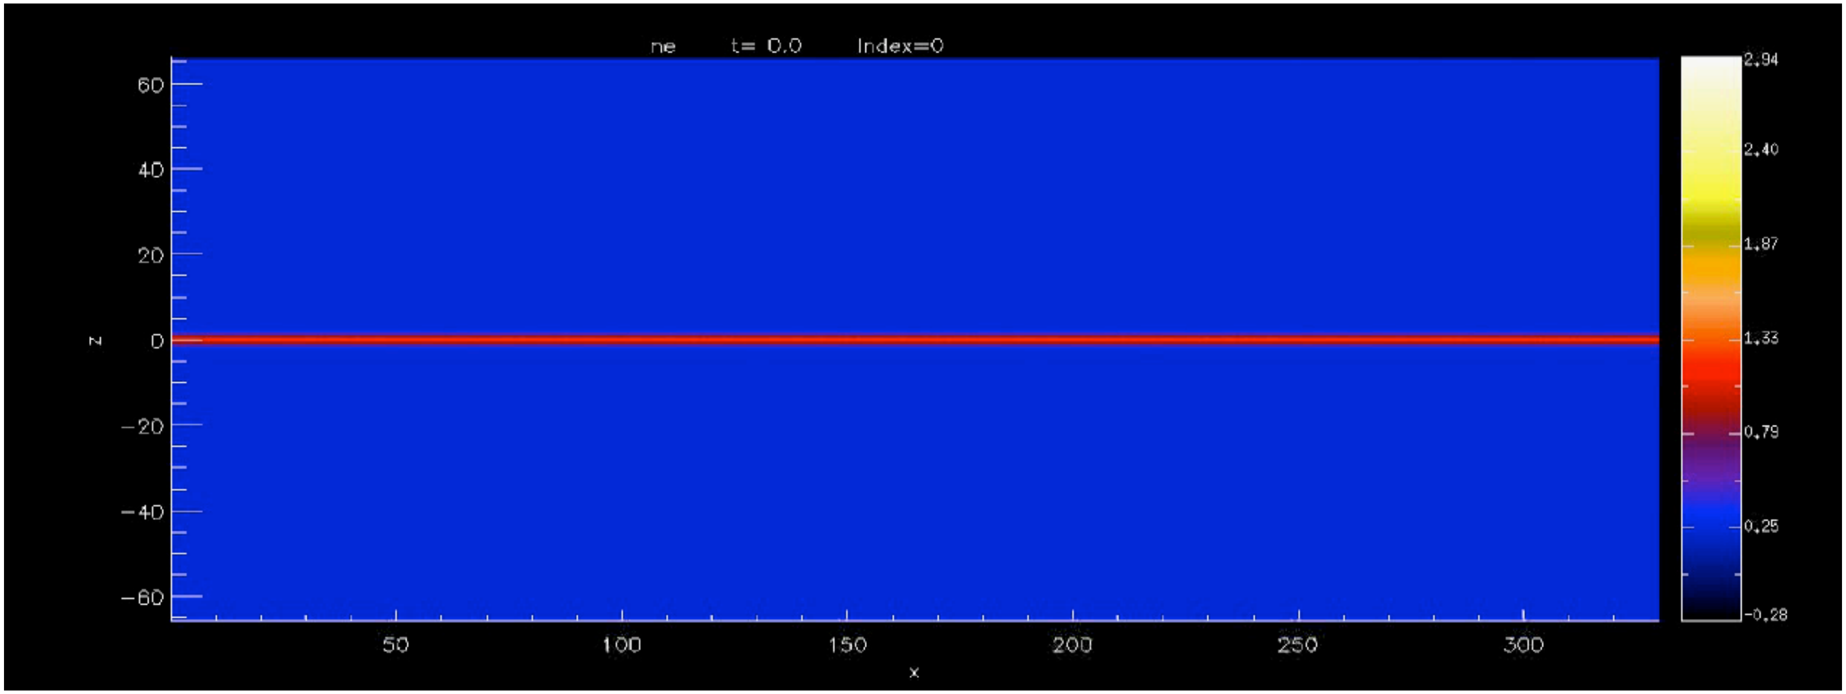
2) Particles injected from upstream: power-law distribution

This explains a number of previous simulation results.

Both periodic (closed) and open boundary systems give spectral index p~1 for high-σ case.

Open boundary simulations with sigma=0.25





The property of relativistic reconnection ($\sigma >> 1$)

- Efficient nonthermal particle acceleration and formation of hard power laws.
- Relativistic inflow and outflow Γ up to 10.
- Reconnection rate is enhanced (locally R~1).
- 2D & 3D are similar. Why?
- Effect of boundary conditions: Periodic, Open, Line-tied...
- What's the implication to large-scale system (AGN, GRB, PWN, etc.)
