Abstract

Neutrinos are the most elusive particles in the universe, capable of traveling nearly unimpeded across it. Despite the vast amount of data collected, a long-standing and unsolved issue is still the association of high-energy neutrinos with the astrophysical sources that originate them. Among the candidate sources of neutrinos, there are blazars, a class of extragalactic sources powered by supermassive black holes that feed highly relativistic jets, pointed toward Earth. Previous studies appear controversial, with several efforts claiming a tentative link between high-energy neutrino events and individual blazars, and others putting into question such relation. In this work, we show that blazars are unambiguously associated with high-energy astrophysical neutrinos at an unprecedented level of confidence, i.e., a chance probability of 6×10^{-7} . Our statistical analysis provides the observational evidence that blazars are astrophysical neutrino factories and hence, extragalactic cosmic-ray accelerators.

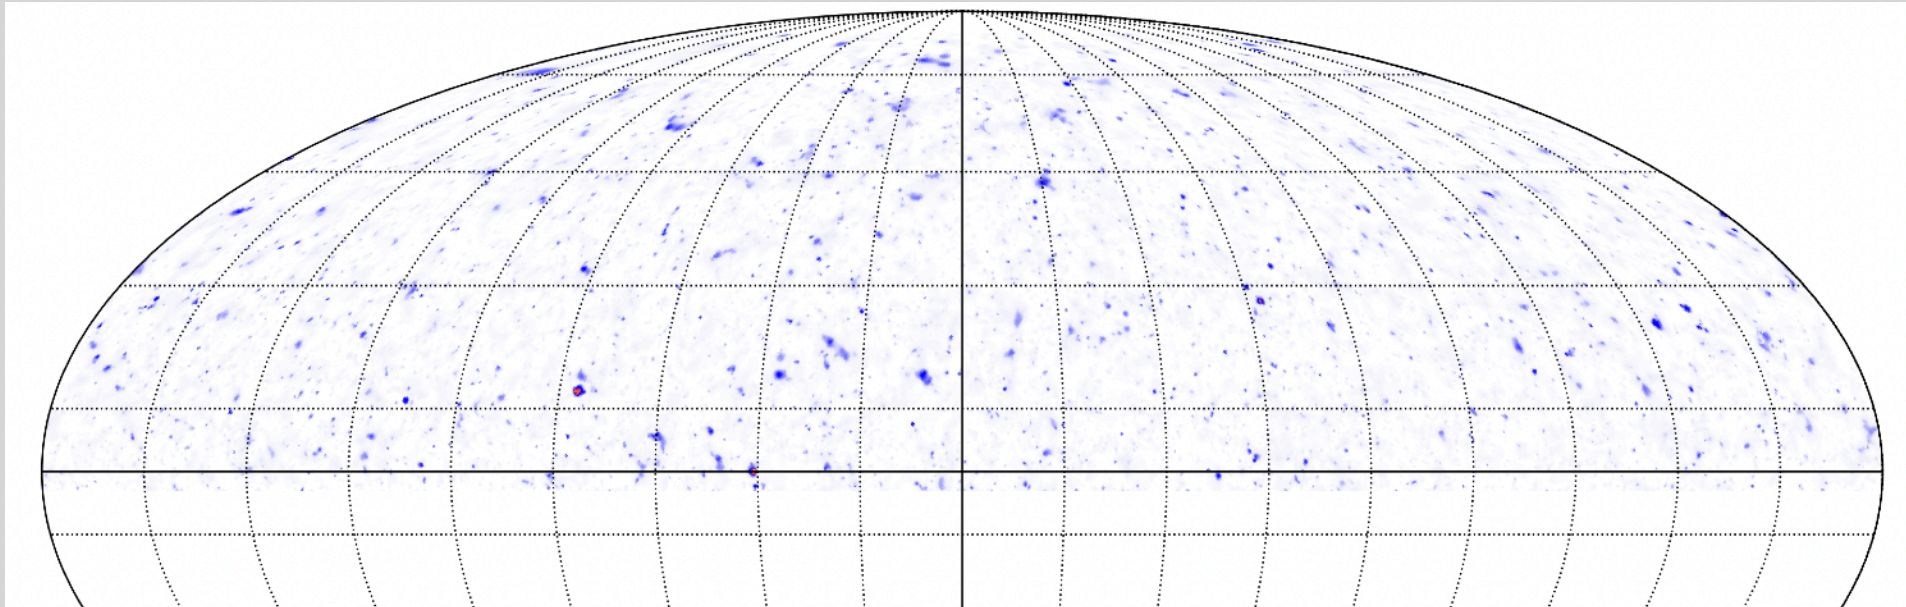

Unified Astronomy Thesaurus concepts: [Neutrino astronomy \(1100\)](#); [Neutrino telescopes \(1105\)](#); [Blazars \(164\)](#); [Supermassive black holes \(1663\)](#); [Relativistic jets \(1390\)](#); [Cosmic ray astronomy \(324\)](#)

IceCube Neutrino (p-value) sky-map

Informs about the level of anisotropy in the event spatial distribution

The smallest the local p-value, the highest the discrepancy from background expectations

For convenience, we define: $L\text{-value} = -\log(\text{p-value}_{\text{Loc}})$

IceCube skymaps: sensitive to comic sources

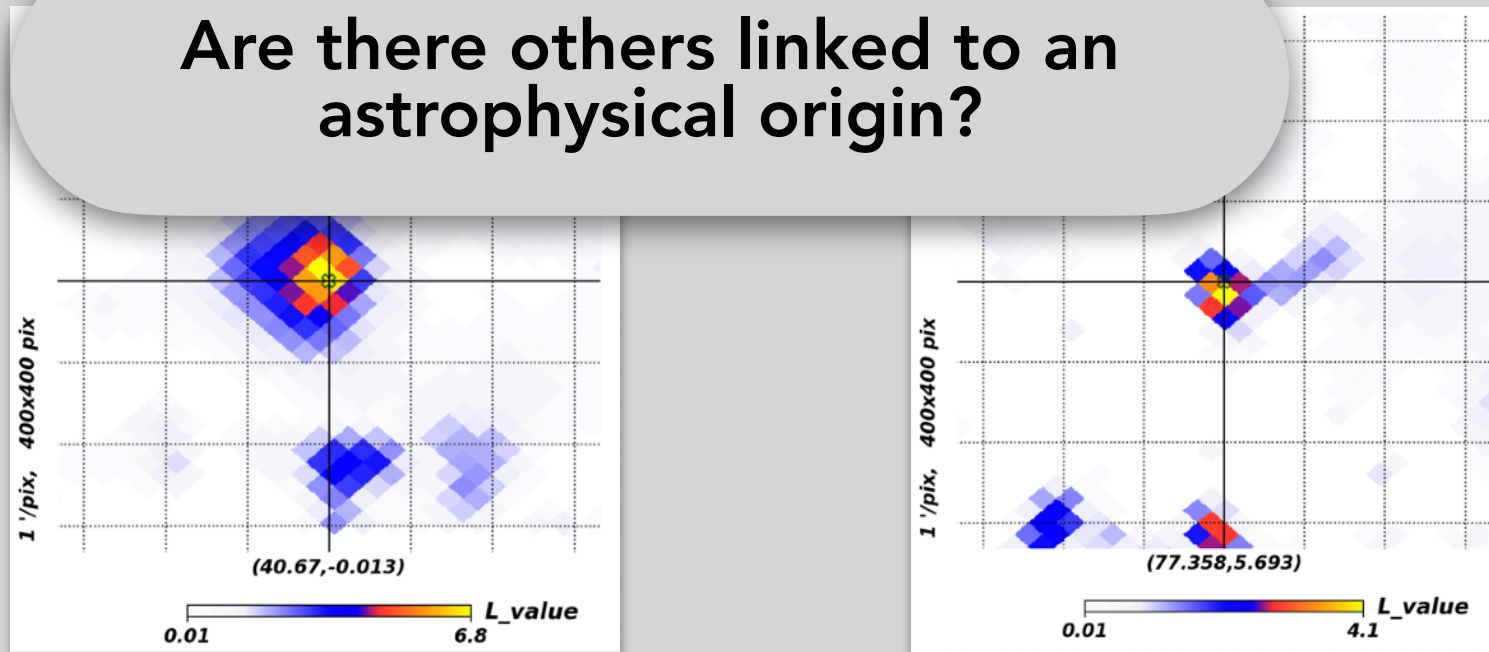

Hotspots consistent with NGC 1068 and TXS 0506+056

IceCube skymaps: sensitive to comic sources

Hotspots consistent with NGC 1068 and TXS 0506+056

Are there others linked to an astrophysical origin?

Skymap: Cross-correlation analysis

Northern and southern hemispheres treated separately

Sky-map : 10^7 pixels (sky locations)

—> Focus on the clusters (spots) with strongest deviation from background expectations — to limit trials

Skymap: Cross-correlation analysis

Summary of findings

Perform positional cross-correlation analysis, between blazar sample and neutrino spot sample.

Combining the (independent) north and south analysis, the global post-trial p-value for the chance correlation is 2.59×10^{-7} .

Sky region	Dataset (energies)	5BZCat	Hotspots	Matches	Pre-trial p-value	Post-trial p-value
North ($-3^\circ \leq \delta \leq 81^\circ$)	9 yr data ($\sim \text{TeV}/\lesssim 0.1 \text{ PeV}$)	2130	66	42	5.12×10^{-4} (3.28σ)	6.79×10^{-3} (2.47σ)
South ($-85^\circ < \delta < -5^\circ$)	7 yr data ($\gtrsim 0.1 \text{ PeV}$)	1177	19	10	3×10^{-7} (4.99σ)	2×10^{-6} (4.5σ)
North + South		–	–	–	3.62×10^{-9} (5.78σ)	2.59×10^{-7} (5.02σ)

Physical properties

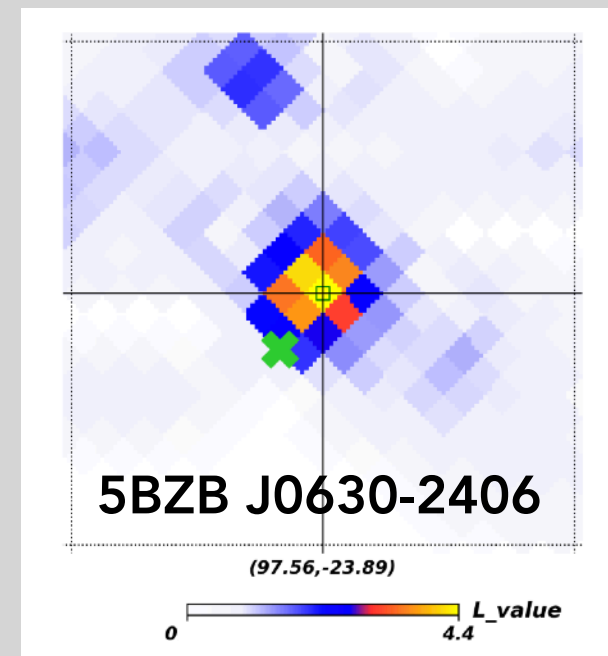

5BZB J0630-2406

Classification

- Source at redshift $z \geq 1.23$
- Historically classified as a BL Lac object : lack of emission lines, high synchrotron peak
- Hints of a luminous accretion disk with broad emission lines swapped by the jet synchrotron (Ghisellini+12).
 - High-power, radiatively efficient blazar, i.e. a **blue flat spectrum radio quasars**, broad lines and a standard accretion disk (a.k.a. **masquerading BL Lacs**)
- Properties similar to TXS 0506+056 and PKS 1424+240

Ghisellini+ 2011, 2012; Padovani+ 2012

IceCube skymap

Multi-Epoch Modeling

Good continuous coverage in optical and gamma rays
Four X-ray observations
Strong, correlated variability in all (available) bands

Start from modelling the SED for T2:

- Serendipitous simultaneous data in the X-ray band:
 - Swift / XMM / NuSTAR
- Complementary optical and Fermi-LAT

Multi-epoch modeling

Theoretical modeling

5BZB J0630-2406

Lepto-hadronic solution

- Luminous accretion disk
 $L_{\text{disk}} \simeq 5 \times 10^{45} \text{ erg} \cdot \text{s}^{-1}$
- Accretion regime $\eta \sim 2 \times 10^{-4}$,
 $L_\gamma/L_{\text{Edd}} = 0.15$.
- Dissipation radius is on the outer edge of the BLR
 - Combination of limited absorption and efficient neutrino production.

Theoretical modeling

5BZB J0630-2406

Lepto-hadronic solution

SED modelled via both purely leptonic and mixed lepto-hadronic scenarios, suggesting that the hadronic component is subdominant, **except in the X-ray and the MeV bands.**

Theoretical modeling

5BZB J0630-2406

Lepto-hadronic solution

Obs. flux νF_ν (erg/cm²/s)

$\chi^2/\text{dof} = 1.7$

- **Evidence for a break in the X-ray spectra (3 sigma).**
- Standard leptonic models face challenges in reproducing it.
- Naturally explained by **the kick-in of the hadronic contribution**

Evolution of the neutrino emission

Increase in neutrino emission relates to change in X-rays
X-rays better proxy for neutrinos than gamma γ rays

Neutrino predictions

Neutrino predicted from theoretical modeling

Epoch	Period	IC	$N_{\mu,events}$
T1 (1)	August 2008 - August 2009	40 / 59	$0.09^{+1.91}_{-0.09}$
T1 (2)	January 2010 - January 2011	59 / 79	$0.21^{+1.79}_{-0.21}$
T1 (3)	June 2010 - June 2011	79 / 86	$0.84^{+3.16}_{-0.84}$
T2	April 2014 - April 2015	86	$0.11^{+1.89}_{-0.11}$

Summary

- A subsample of candidate PeVatron blazars proposed as associated with IceCube neutrino hotspots; post-trial probability of $\sim 2.59 \times 10^{-7}$.
- Theoretical modelling of MWL SED confirms plausible neutrino emitter: Candidate association, 5BZB J0630-2406:
 - X-ray flare happening during the 7yr IceCube observation
 - SED modeling predicts variable neutrino emission
 - Consistent with an increase in the observed neutrino event rate
 - Overall properties similar to TXS 0506+056; contributing $<1\%$ to the diffuse neutrino flux
- *'Tip of the iceberg'* : other individual sources may be already detectable in the 15-yr (proprietary) IceCube datasets
- Analysis and results fully reproducible:
 - Datasets available via e.g. Zenodo.
 - Software hosted e.g. in GitHub. First public release: AM³.

Back up

Multi-epoch modeling

Leptonic solutions

Theoretical modeling

5BZB J0630-2406

Leptonic / Lepton-hadronic modeling

- Simulation of the acceleration and the cooling of electrons and / or protons inside of a spherical region (blob) with the AM³ code (Gao+ 2017, Klinger+ 2023).
- Spherical region moving at relativistic speed inside the jet surrounded by an accretion disk and a dust torus emitted as black bodies.
- Emission from the accretion disk is reprocessed by the BLR.
- Parameters are fitted to reproduce the SED by minimising the $\chi^2_{\text{d.o.f}}$ between the simulated and the observed data.

Neutrino point-source Searches

Observational Approach

Blazar sample

- 5BZCat (Massaro+ 2015)
- no preferred selection

IceCube neutrino data

The 'highest-quality' data for point-source searches publicly available

- Southern hemisphere
- 7-year sky map
 - 2008 - 2015

IceCube coll. 2017

- Northern hemisphere
- 10-year sky map
 - 2011 - 2020

IceCube coll. 2022

Test a few different (inclusive) neutrino samples

Southern hemisphere analysis

- Neutrino spot = i.e. sky-location (pixel-map)
 - $0.1^\circ \times 0.1^\circ$ map resolution
- $L_{\min} = \{3.5, 4.0, 4.5\}$
 - 44, 19, 9 neutrino spots
- $R_{\text{assoc}} = [0.4^\circ, 0.7^\circ]$ with steps of 0.05°
 - Driven by median angular resolution of the neutrino events

Buson+ 2022

IceCubePy

an open software for neutrino data analysis

- IceCube released 10-yr (old, muon-track) dataset
- No public software available for the analyses of the data

IceCubePy

promising preliminary results

- based on simulations and cross-checks

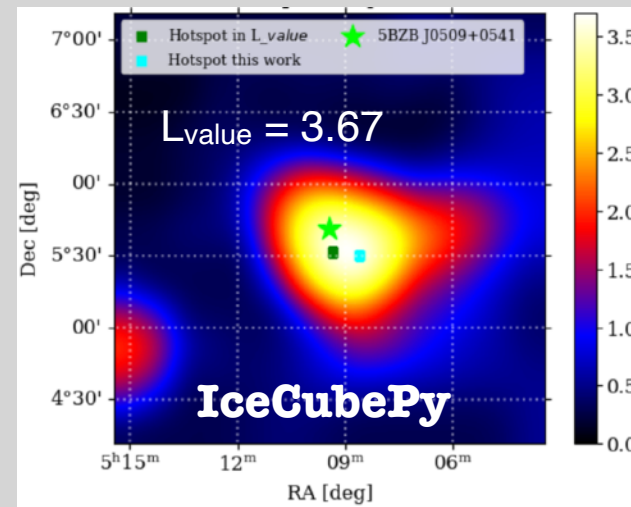

e.g. TXS 0506+056 hotspot — — —>

- **IceCube coll. (publication):**
 - $L_{\text{value}} = 3.7$

(planning public release in GitHub)

ICRC 2023

TXS 0506+056 region (IceCube public dataset)

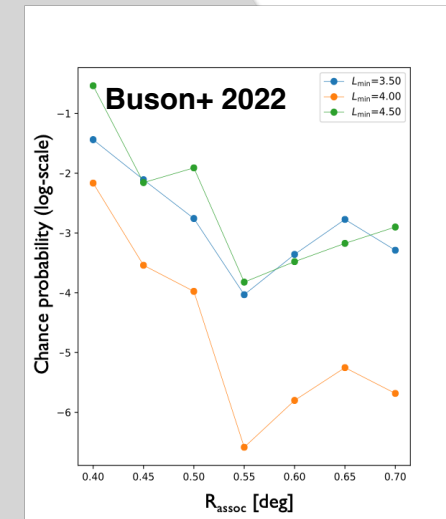

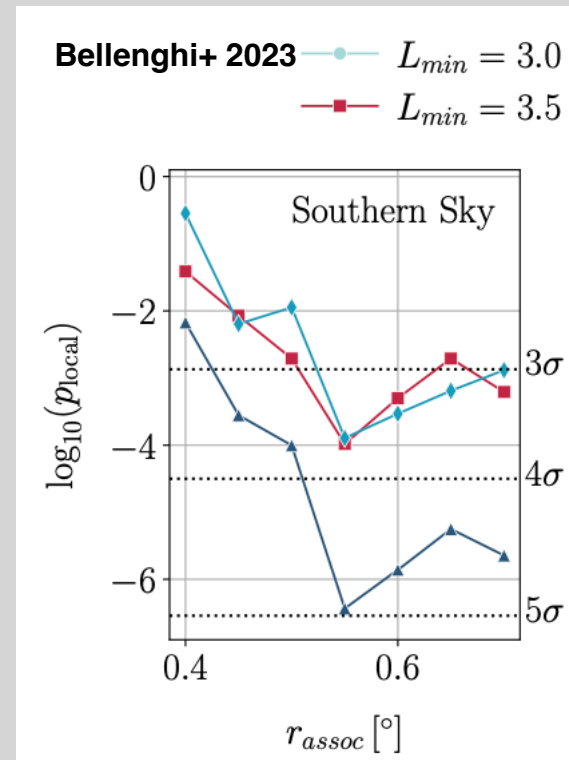

Independent confirmation

Independent works confirm the correlation reported in Buson+ 2022.

E.g. Bellenghi+ 2023, when using the “official” IceCube collaboration high-level data (i.e. skymaps), and same analysis strategy.

For the 7-yr southern skymap:

- Same hotspots ($L_{\text{value}} > 4.0$) are found
- Correlation between 5BZCat / hotspots :
 - post-trial $p_{\text{value}} \sim 2 \times 10^{-6}$ ($\sim 4.6\sigma$)

Comparison with publicly available code/data

Discrepancy in the analysis results (southern hemisphere)
